Iowa State University Incinerator Procedures

The incinerator provides for the sanitary disposal of animal carcasses, tissue, and bedding that may or may not be contaminated with disease-causing organisms. EH&S also incinerates many non-regulated organics, radiological combustibles, animals, and certain contraband seized by law enforcement agencies.

A completed waste for incineration tag must be attached to any material brought to the incinerator.

When possible, autoclaving should be the preferred method of decontaminating biological materials. Please reference the sharps and biohazardous procedure and the disposal flowchart at the link below.
